Raise a Smarter Child by Kindergarten

Raise IQ by up to 30 points and turn on your child's smart genes

Harmony **Nature didn't finish your child's brain at birth. It's up to you to maximize your child's mental skills without causing additional stress. Acclaimed neurologist and bestselling author of Grain Brain, David Perlmutter, MD, offers these valuable tools: Simple games to reinforce memory pathways in the brain Information on common household products and children's toys that contain brain-damaging neurotoxins The right foods and supplements to boost intelligence and turn on your child's smart genes How to turn the television, the computer, and video games into educational tools Proven ways to reduce the risk of your child developing ADD and ADHD Between birth and age five, your child has up to thirty IQ points at stake. Scientists now know that the human brain is undergoing a constant and dramatic transformation in the first years of life. During this peak time of development, every activity and experience leaves an indelible mark on your baby's brain, for better or worse. The right kind of stimulation and nutrition will create connections in the brain that promote intelligence and raise IQ. The wrong kinds of activities and foods can stifle intellectual development, destroy brain cells, and leave your child more vulnerable to learning or behavior problems down the road. So, what can you do during the first five years to ensure that your child is primed to excel? The good news is that raising a smarter child is easier than you think. It doesn't require making an investment in expensive equipment or high priced tutors. It's as simple as playing the right games, serving the right foods, and maintaining a brain-enhancing environment in your home by eliminating common household toxins. In Raise a Smarter Child by Kindergarten by Dr. David Perlmutter, you'll learn easy and highly effective strategies that can vastly improve your child's brain power and reduce his or her chances of developing ADD and ADHD. For example, you can: Stimulate Memory: Changing a component on the over-the-crib mobile every week makes the baby compare what was there before to what's there now, reinforcing memory pathways in the brain that are critical for learning. Spread out those shots: Schedule more frequent trips to the pediatrician for vaccinations, so that fewer shots are administered at once. Flooding the immune system with a cocktail of different vaccines can damage the nervous system. Get rid of toxins: Protecting a child from neurotoxins found in foods, toys and even baby bottles can help preserve precious IQ points. Inside, Dr. Perlmutter provides a scientifically backed food and supplement plan for children and nursing mothers and details the many brain-building activities that you can do with your child. In addition, he reveals the numerous toys and household products that contain harmful, brain-damaging toxins and shows how to identify and combat common childhood problems like ADD and food allergies that may affect your child's development. Your job over the first five years is to help your child**

build the best brain possible. With Dr. Perlmutter's help, you can mine the countless opportunities you have each day to make your child smarter, happier and better prepared to excel.

The Sociology of Schools

Routledge The sociology of education is concerned not just with the abstract theory but with the day-to-day experiences of pupils and teachers. In this up-to-date account of the main developments in the subject, Karen Chapman shows how education offers a rich and varied field for sociologists, one easily accessible for study. She begins by setting the subject in its historical post-War context. She then goes on to outline comprehensively the subject's theoretical base and analyses the factors that influence educational change. Specific chapters deal with the topical subjects of educational under-achievement, gender, race and the trend towards a vocational element in curriculum.

The Truth about Intelligence

SAGE `In this remarkably economical, clear and informed book, Mike Howe... sets about unravelling the formidable semantic, logical and empirical knots into which IQ testers and their supporters have tied themselves.... Howe suggests that we have, for decades, been asking the wrong kinds of questions. He points to the number of alternative, theoretically richer, views of human intelligence that don't reduce all to a single dimension... this is rendered with an easy, readable style which assumes no previous technical knowledge' - **British Journal of Educational Psychology** In this provocative and accessible book, Michael Howe exposes serious flaws in our most widely accepted beliefs about intelligence. He shows that cr

Associations between Reading and Mathematics: Genetic, Brain Imaging, Cognitive and Educational Perspectives

Frontiers Media SA **Converging evidence demonstrates a strong link between reading and mathematics: multiple cognitive processes are shared between reading and mathematics, including the representation and retrieval of symbolic information, attention, working memory, and cognitive control. Additionally, multiple brain networks are involved in both math and reading, and last, common genetic factors might influence both reading and math. Hence, it comes as no surprise that there are meaningful associations between (aspects of) math and reading abilities. Moreover, comorbidity rates between math learning disabilities (MD) and reading disabilities (RD) are high (up to 66%) and prevalence rate of the comorbid condition is reported to be more common than the prevalence rate of isolated math learning disabilities. Accordingly, the goal of the research topic is to explore the underline mechanisms of this overlap between reading and math. The research topic aims to include the following topics:**

- **Genetics** - it has been found that both RD and MD are based on genetic factors and run in families. Moreover, math problem solving shares significant genetic overlap with general cognitive ability and reading decoding, whereas math fluency shares significant genetic overlap with reading fluency and general cognitive ability. Hence, this topic will explore the shared and unique genetic risk factors to RD and MD, In addition to shared and unique genetic influence on reading and math.
- **Neural perspective** - converging evidence from both structural and multiple functional imaging studies, involving a wide range of numerical tasks, points to the intraparietal sulcus (IPS) as a core region that involve in quantity manipulation. However, several additional brain areas, such as frontoparietal and temporoparietal areas were found to be involved in numerical tasks. Individuals with MD show deficits in a distributed, set of brain regions that include the IPS, fusiform gyrus in posterior brain regions and pre frontal cortex regions. Similarly, converging evidence indicate that the left hemisphere regions centered in the fusiform gyrus, temporoparietal cortex, and pre frontal cortex regions are strongly involve in typical reading and present lower activity, connectivity or abnormal structure in RD. Thus, there is a meaningful neural overlap between reading and math. Hence, the authors can submit empirical studies on the role of several of brain regions that are involved in math and reading (commonality and diversity) both in the typical and a-typical development.
- **Cognitive factors that play role in mathematics and reading, and comorbidity between RD and MD** - There is a long lasting debate whether MD and RD originate from unique cognitive mechanisms or not. Multiple cognitive processes are shared between reading and mathematics. Therefore, impairments in any one of domain-general skills could conceivably play an important role in both pure and comorbid conditions. Moreover, it has been suggested that phonological processing has a significant role in some aspects of numerical processing such as retrieval of arithmetical facts.
- **Education** - it will be interesting to look at the effect of interventions that aim to improve reading (such as phonological awareness) and there transfer effect on improving mathematical processing. Alternatively, it will be good to test whether math interventions will improve reading.
