The Decade Ahead

Logistical Excellence

It's Not Business As Usual

**Elsevier** Benefit from the practices of the best logistics managers One of the nation's top authorities on logistics management presents a focused interpretation of research findings to help managers improve logistical competency within their organizations. Zeroing in on the best practices of successful logistic managers - and well supported by statistical evidence this handbook provides a sequential model as well as extensive coverage of Electronic Data Interchange in the logistics process. You'll find out why logistics must play an increasingly critical role in overall corporate strategy in the coming years, and why its managers must learn to better manage change. Special emphasis is placed on the development of strategic alliances to increase corporate speed and quality. Throughout the eight chapters, an action-oriented case dialogue facilitates interest and ease of reading.

The Transport System and Transport Policy

An Introduction

**Edward Elgar Publishing** This very interesting book provides an excellent multi-disciplinary introduction into the functioning of transport systems and the interaction with their environments. • Erik Verhoef, VU University Amsterdam, The Netherlands The editors of this important book have clearly identified that few writings on transport treat the transport system as a whole. Implicit in this is a need for a genuinely multidisciplinary approach. An impressive list of contributors ensures that the book draws on the latest research whilst providing new insights into some of the key challenges facing transport students and researchers, transport providers and policy makers. • Roger Vickerman, University of Kent, UK Since ancient times transportation has brought our world together. But the need for connectivity and accessibility in a spatially differentiated world has prompted the emergence of very complex transportation systems. This book offers a fresh and operational contribution to a better understanding of the complexity and manageability of a

mobile world, by addressing in a balanced way both conceptual and applied or policy aspects of modern transportation systems. ð Peter Nijkamp, Free University of Amsterdam, The Netherlands Transport impacts on people and businesses in many different ways, and presents some of the key problems that decision-makers need to address. This comprehensive textbook introduces the transport system in a holistic and multidisciplinary way, bringing together the myriad components of transport. This textbook is written for an international readership of undergraduate and postgraduate students in transport and related subjects, as well as for professionals and policy decision-makers across both public and private sectors. Key features include: ¥ Discussion of the importance of transport accessibility and the impacts of transport on the environment and safety ¥ Policy issues relating to all of the discussed issues and prescribed future options. ¥ Transport evaluation methods and modelling approaches. ¥ Examples to highlight the linkages between components of the transport system ð for example infrastructures, land-use, vehicle technologies ð and the relevance of these linkages for decision making.

Sensitivity Analysis for Coupled Aero-structural Systems

A novel method has been developed for calculating gradients of aerodynamic force and moment coefficients for an aeroelastic aircraft model. This method uses the Global Sensitivity Equations (GSE) to account for the aero-structural coupling, and a reduced-order modal analysis approach to condense the coupling bandwidth between the aerodynamic and structural models. Parallel computing is applied to reduce the computational expense of the numerous high fidelity aerodynamic analyses needed for the coupled aero-structural system. Good agreement is obtained between aerodynamic force and moment gradients computed with the GSE/modal analysis approach and the same quantities computed using the brute-force, computationally expensive, finite difference approximations. A comparison between the computational expense of the GSE/modal analysis method and a pure finite difference is presented. These results show that the GSE/modal analysis approach is the more computationally efficient technique if sensitivity analysis is to be performed for two or more aircraft design parameters.
