#### Advances in Hydroscience

*Elsevier* **Advances in Hydroscience, Volume 12-1981 covers articles in the areas of fluid mechanics and hydrology. The book presents articles on advances in cavitation research, applied stochastic theory of storage in evolution, and echohydrodynamics. The text also includes articles on the usefulness and the basic nature of the application of pattern recognition in the context of hydrologic data analysis. A summary of the Hydrologic Engineering Center's experience in water resources system simulation is also encompassed. The book will prove invaluable to hydrologists, practitioners handling the design and control of hydraulic structures and machinery, and engineers working in the water industry.**

Portable Ventilation Systems Handbook

*CRC Press* Portable ventilation systems provide an option for supplementing installed ventilation, as well as providing a system for ventilation where none exists. Portable Ventilation Systems Handbook discusses the various types of portable ventilation systems currently in use, their advantages and disadvantages, and what systems works best for what function.

Ecosystem-Based Fisheries Management

Confronting Tradeoffs

*Cambridge University Press* Responsible fisheries management is of increasing interest to the scientific community, resource managers, policy makers, stakeholders and the general public. Focusing solely on managing one species of fish stock at a time has become less of a viable option in addressing the problem. Incorporating more holistic considerations into fisheries management by addressing the trade-offs among the range of issues involved, such as ecological principles, legal mandates and the interests of stakeholders, will hopefully challenge and shift the perception that doing ecosystem-based fisheries management is unfeasible. Demonstrating that EBFM is in fact feasible will have widespread impact, both in US and international waters. Using case studies, underlying philosophies and analytical approaches, this book brings together a range of interdisciplinary topics surrounding EBFM and considers these simultaneously, with an aim to provide tools for successful implementation and to further the debate on EBFM, ultimately hoping to foster enhanced living marine resource management.

MARTHA

User's Manual

*Mit Press* MARTHA is a set of general-purpose programs for analyzing linear electrical networks, available to users with access to APL time-sharing systems. The programs analyze, as a function of frequency, most linear "transmission-type" networks, with an input and an output. This includes most filters, amplifiers, microwave networks, and feedback systems, even if such circuits are relatively complicated, with multiple feedback paths and branches. The programs cannot handle some complicated interconnections of components, and are not set up to analyze nonlinear or time varying networks. The topology of the network is described using "wiring operators." The elements available include lumped and distributed, active and passive, reciprocal and nonreciprocal elements. The possible output includes tow-port parameters (impedance, admittance, hybrid, scattering, and ABCD matrices), as well as voltage gain, insertion gain, transducer gain, etc. These, their real or imaginary parts, or magnitude or phase, may be printed or plotted as functions of frequency or of each other. More than one network can be analyzed simultaneously. MARTHA is not inherently better at one frequency range than another, except perhaps in its repertoire of elements and response functions. MARTHA includes, besides R, L, and C, sixteen

controlled sources; operational amplifiers; mutual inductance; three transistor models and the possibility of easily creating others; ideal transformers; several composite pi and tee structures; and a few exotic elements such as gyrators. For high-frequency applications MARTHA has several microwave elements, including TEM transmission lines, waveguides, attenuators, and isolators.
